XGBoost	Validation		0.475	40.1%	65.7%

This dashboard is a decision-support tool for monitoring predicted high-volatility risk across a portfolio of 502 securities. It combines model-generated risk scores, configurable alert thresholds, security and sector filters, historical risk trends, model-performance results, and risk-driver analysis. The dashboard is intended to help analysts identify elevated-risk securities, investigate volatility patterns, and understand the factors influencing model predictions.

How to Use This Dashboard

1. Adjust the Risk Threshold to change the minimum risk score required to generate an alert.
2. Use the Sector, Security, and Date Range filters to focus the analysis.
3. Review the KPI cards to monitor portfolio coverage, alert rate, actual volatility events, detection rate, and precision.
4. Use the risk-signal chart to compare average predicted risk with the selected alert threshold over time.
5. Review the sector chart and latest-alert table to identify areas requiring further investigation.
6. Open the Model Insights page to evaluate final-test performance, compare validation models, and review the strongest volatility-risk drivers.
